Article 9 Risk management system

legal text summary:

The EU AI Act requires a risk management system for high-risk AI systems. This system should be a continuous process throughout the AI's lifecycle, regularly reviewed and updated. It should identify and analyze potential risks to health, safety, or fundamental rights, estimate and evaluate these risks, and adopt measures to manage them. These measures should balance minimizing risks and fulfilling requirements. The system should also ensure that any remaining risk is acceptable and that measures are in place to eliminate or reduce risks as much as possible. High-risk AI systems should be tested to identify the best risk management measures and to ensure they work as intended. The system should also consider whether the AI could negatively impact people under 18 or other vulnerable groups.

Article 10 Data governance

legal text summary:

This article states that high-risk AI systems must be developed using high-quality data sets for training, validation, and testing. These data sets should be managed properly, considering factors like data collection processes, data preparation, potential biases, and data gaps. The data sets should be relevant, representative, error-free, and complete as much as possible. They should also consider the specific context in which the AI system will be used. In some cases, providers may process special categories of personal data to detect and correct biases, but they must follow strict conditions to protect individuals' rights and freedoms.

Article 11 Technical documentation

legal text summary:

This EU law states that before a high-risk AI system is launched, detailed technical documentation must be prepared and kept updated. This documentation should prove that the AI system meets the law's requirements and provide clear information for authorities to check compliance. It should include certain key elements. Small businesses, including start-ups, can provide this information in a simpler way. The EU will create a simplified form for this purpose. If a high-risk AI system is related to a product covered by other EU laws, one set of documentation should include all necessary information. The EU can update these requirements as technology advances.

Article 14 Human oversight

legal text summary:

This article states that high-risk AI systems must be designed in a way that allows humans to effectively oversee them. The goal of human oversight is to prevent or minimize risks to health, safety, or fundamental rights that may arise from using these systems. The oversight measures should match the risks and context of the AI system's use. These measures could be built into the system by the provider or implemented by the user. The AI system should be provided in a way that allows the overseer to understand its capabilities and limitations, detect and address issues, avoid over-reliance on the system, interpret its output, decide not to use it, or stop its operation. For certain high-risk AI systems, any action or decision based on the system's identification must be verified by at least two competent individuals.
